

CLAIMS

1. An electrically controllable device having variable optical and/or energy properties or an
5 electroluminescent device, comprising at least one carrier substrate (1, 1') carrying an electroactive multilayer stack (3) that is placed between an electrode called the "lower" electrode and an electrode called the "upper" electrode, each electrode comprising
10 at least one electrically conducting layer (2, 2') in electrical connection with at least one current bus, **characterized in that** at least one of the current buses is in electrical connection with at least one current lead suitable for distributing, over the surface of at
15 least one of the conducting layers (2, 2'), electrical energy so as to convert the electrical energy into light uniformly within the electroactive multilayer stack (3).
- 20 2. The device as claimed in claim 1, **characterized in that** the current lead comprises either conducting wires (4) or a network of wires running over or within the layer (2, 2') forming the electrode.
- 25 3. The device as claimed in claim 2, **characterized in that** the conducting wires (4) are metal wires, for example made of tungsten (or copper), optionally covered with a surface coating, with a diameter of between 10 and 100 μm and preferably between 20 and
30 50 μm , which are straight or corrugated, and deposited on a sheet of thermoplastic (5).
4. The device as claimed in claim 1 or claim 2, **characterized in that** the "lower" electrode comprises
35 an electrically conducting layer (2) covering a region of the carrier substrate, especially one that is essentially rectangular, the lower electrode (2) being based on a doped metal oxide, especially tin-doped indium oxide called ITO or fluorine-doped tin oxide

F:SnO₂, or aluminum-doped zinc oxide Al:ZnO for example, optionally deposited on a prelayer of the silicon oxide, oxycarbide or oxynitride type, having an optical function and/or an alkali metal barrier function when the substrate is made of glass.

5. The device as claimed in claim 1 or claim 2, **characterized in that** the conducting layer (2) forming the "lower" electrode may be a bilayer formed from an SiOC first layer of between 10 and 150 nm, especially 20 to 70 nm and preferably 50 nm thickness, surmounted by an F:SnO₂ second layer of between 100 and 1000 nm, especially 200 to 600 nm and preferably 400 nm thickness.

6. The device as claimed in claim 5, **characterized in that** it comprises a bilayer formed from a first layer based on SiO₂ doped with a little metal of the Al or B type, about 20 nm in thickness, surmounted by an ITO second layer of about 100 to 300 nm thickness.

7. The device as claimed in claim 5, **characterized in that** it comprises a layer formed from ITO about 100 to 300 nm in thickness.

8. The device as claimed in claim 1, **characterized in that** the active system (3) is made up of a multilayer stack comprising: at least one HIL layer (3a) based on an unsaturated, especially polyunsaturated, heterocyclic compound such as a copper or zinc phthalocyanine or a PEDT/PSS compound 5 nm in thickness; an HTL layer (3b), 50 nm in thickness, of N,N'-diphenyl-N,N'-bis(3-methylphenyl)-1,1'-biphenyl-4,4'-diamine (TPD) or N,N'-bis-(1-naphthyl)-N,N'-diphenyl-1,1'-biphenyl-4,4'-diamine (α -NPD); a layer (3c), 100 nm in thickness, of evaporated molecules of the complex AlQ₃ (aluminum tris(8-hydroxyquinoline)) optionally doped with a few percent of rubrene, DCM or quinacridone; and an ETL layer (3d), 50 nm in

thickness, of 2-(4'-biphenyl)-5-(4''-tert-butylphenyl)-1,3,4-oxadiazole (t-Bu-PBD) or 3-(4'-biphenyl)-4-phenyl-5-(4''-tert-butylphenyl)-1,2,4-triazole (TAZ).

5 9. The device as claimed in claim 1, **characterized in that** the active system (3) is made up of a multilayer stack comprising: at least one HIL layer (3a) made of PEDT/PSS 50 nm in thickness; and a layer (3b) of polymers based on PPV, PPP, DO-PPP, MEH-PPV or CN-PPV,
10 100 nm in thickness.

10. The device as claimed in claim 1, **characterized in that** the active system (3) is made up of a multilayer stack comprising: at least one layer (3a) based on an
15 active material 500 nm in thickness, such as for example sulfides like Mn:ZnS, Ce:SrS, or Mn:Zn₂SiO₄, Mn:Zn₂GeO₂ or Mn:ZnGa₂O₄, this layer (3a) being joined on either side to insulating layers (3e, 3f) made of a dielectric (Si₃N₄, Al₂O₃/TiO₂ or BaTiO₃) with a thickness
20 of 150 nm.

11. The device as claimed in claim 1 and claim 10, **characterized in that** the electrically conducting layer (2') forming the upper electrode is based on a metal or
25 metal alloy of aluminum.

12. The device as claimed in claim 1 and claims 8 and 9, **characterized in that** the electrically conducting layer forming the upper electrode (2¹) is based on an
30 electropositive metal (Al, Mg, Ca, etc.) or an alloy of said metals.

13. The device as claimed in one of the preceding claims, **characterized in that** at least one of the two
35 electrodes, preferably the "upper" electrode, comprises an electrically conducting layer joined to a network (4) of conducting wires/conducting strips.

14. The device as claimed in claim 13, **characterized**

in that the conducting network (4) comprises a plurality of essentially metallic wires placed on the surface of a sheet (5) of polymer, especially of the thermoplastic type.

5

15. The device as claimed in claim 13 or claim 14, **characterized in that** the wires/strips (4) are placed essentially parallel to one another, preferably in an orientation essentially parallel to the length or the
10 width of the electrically conducting layer (2') of the "upper" electrode, the ends of said wire/strips extending beyond the substrate region covered by said electrically conducting layer on two of its opposed edges, especially by at least 0.5 mm.

15

16. The device as claimed in one of claims 13 to 15, **characterized in that** the ends of the wires/strips (4) joined to the electrically conducting layer (2) of the "lower" electrode are electrically connected to current
20 buses in the form of flexible strips (6a, 6b) made of insulating polymer, these being covered on one of their faces with a conductive coating.

17. The device as claimed in claim 16, **characterized in that** said current buses are in the form of
25 conducting clips that grip the carrier substrate (1, 1').

18. The device as claimed in claim 16, **characterized in that** the set of current buses for the "lower" and
30 "upper" electrodes are brought together in the form of a strip of approximately rectangular shape, formed from an electrically insulating and flexible polymer support, with, on two opposed edges, a conductive
35 coating on one face and, on its other two edges, a conductive coating on the face on the opposite side from the previous one, preferably with a single external electrical connector.

19. The device as claimed in one of the preceding claims, **characterized in that** at least one of the current buses is in the form of a shim (14a, 14b, 15a, 15b), especially a metal strip, or in the form of one or more conducting wires, or in the form of a point lead made of conducting material.

20. The device as claimed in one of the preceding claims, **characterized in that** the electroactive stack (3) covers a carrier substrate region which is a polygon, a rectangle, a diamond, a trapezoid, a square, a circle, a semicircle, an oval or any parallelogram.

21. The device as claimed in one of the preceding claims, **characterized in that** it makes up an electroluminescent system.

22. The device as claimed in claim 21, **characterized in that** the system is transparent.

23. The device as claimed in claim 21, **characterized in that** it is an electroluminescent glazing unit, especially of laminated structure.

24. The device as claimed in claim 21, **characterized in that** the electroluminescent glazing unit comprises at least one flat glass pane and/or at least one curved glass pane.

25. The device as claimed in one of claims 21 to 24, **characterized in that** it also includes at least one of the following coatings: an infrared-reflecting coating, a hydrophilic coating, a hydrophobic coating, a photocatalytic coating with anti-fouling properties, an anti-reflection coating, an electromagnetic shielding coating.

26. The device as claimed in one of claims 21 to 24, characterized in that the carrier substrate (1) is

rigid, semirigid or flexible.

27. The use of a device as claimed in any one of claims 1 to 25 as glazing for automobiles or buildings.
